

SEO Audit Report

<https://www.compresspic.top/>

Audit date: 2026-06-22

Domain: compresspic.top

Business type: Free web-based SaaS tool (image compression, browser-only / privacy-first)

Stack: Cloudflare (CDN/WAF), React SPA + Vite, static prerender per locale, GA4

Indexed pages: 9

72 / 100

SEO Health Score

Category Scores

Category	Score
Technical SEO	60 / 100
Content Quality	70 / 100
On-Page SEO	78 / 100
Schema / Structured Data	70 / 100
Performance (CWV)	65 / 100
AI Search Readiness	50 / 100
Images	75 / 100

Top Critical Issues

[Critical] Canonical uses non-www but server serves www

[High] Trailing-slash 307 redirect mismatches canonical/sitemap

[High] All unknown URLs return 200 (SPA shell fallback, no 404)

[High] No llms.txt (route returns SPA shell)

[Medium] SoftwareApplication schema missing author, datePublished, softwareVersion

Top Quick Wins

- Add `<link rel='preload' as='image' href='/assets/frog-hero-bg-1600.webp'>` to `<head>` — saves 200–500ms LCP
- Long-cache `/assets/*` with `Cache-Control: public, max-age=31536000, immutable`
- Expand zh-CN/zh-TW/ja-JP meta descriptions from 45/43/74 chars to 90–120 chars
- Create a real `/llms.txt` with a plain-text site description
- Add Organization schema linking to `github.com/joye61/pic-smaller`

Full SEO Audit Report — compresspic.top

URL: <https://www.compresspic.top/>

Domain: compresspic.top

Audit date: 2026-06-22

Auditor: Claude (claude-seo:seo-audit)

Stack: Cloudflare (CDN/WAF) + React 18 SPA + Vite + static prerender per locale

Executive Summary

SEO Health Score: 72 / 100

Category	Weight	Score
Technical SEO	22%	60
Content Quality	23%	70
On-Page SEO	20%	78
Schema / Structured Data	10%	70
Performance (CWV)	10%	65
AI Search Readiness	10%	50
Images	5%	75

Business type: Free, browser-based image compression tool (Software-as-a-Service / utility tool). Multi-language (9 locales: zh-CN, en-US, zh-TW, ja-JP, ko-KR, fr-FR, es-ES, tr-TR, fa-IR).

Top 5 critical issues:

Canonical/www host mismatch (Critical). Every page's `<link rel="canonical">` and hreflang points to <https://compresspic.top/...> (no `www`), but the server actually serves pages at <https://www.compresspic.top/...>. Both versions return HTTP 200 with self-referencing canonicals, so Google sees two indexable copies of every page.

Trailing-slash 307 redirect mismatches canonical/sitemap. Sitemap and canonical declare `/en-US/` but the server 307s `/en-US/` → `/en-US` (no slash). Google fetches the canonical URL, gets a redirect, before landing on the actual content.

All unknown paths return 200 with SPA shell (no 404). `/about`, `/privacy`, `/blog`, `/random-nonexistent-page` all return the homepage HTML with HTTP 200. Search engines may index phantom pages. A `404.html` exists locally but is not served.

`/llms.txt` returns the SPA shell HTML. LLM crawlers following the llmstxt.org convention (Anthropic, OpenAI, Cursor) get garbage instead of a plain-text site description.

SoftwareApplication schema missing **author**, **datePublished**, **softwareVersion**. Google cannot link this app to its author identity or surface version metadata.

Top 5 quick wins:

Add `<link rel="preload" as="image" href="/assets/frog-hero-bg-1600.webp">` and `<link rel="modulepreload" href="/assets/index-CyHHZpPs.js">` to `<head>` — saves 200–500ms on LCP.

Long-cache `/assets/*` with `Cache-Control: public, max-age=31536000, immutable` (filenames are content-hashed).

Expand zh-CN, zh-TW, ja-JP meta descriptions from 45 / 43 / 74 chars to 90–120 chars.

Create a real `/llms.txt` with a plain-text site description for LLM crawlers.

Add `Organization` schema linking to github.com/joye61/pic-smaller and a small footer link to the GitHub repo.

Technical SEO — Score: 60 / 100

What works

- HTTPS enforced via Cloudflare.
- `robots.txt` properly configured with `Sitemap:` reference.
- `Sitemap.xml` present with all 9 locales.
- Cloudflare CDN with HTTP/2 + alt-svc (HTTP/3).
- AI-training opt-out via `Content-Signal: search=yes, ai-train=no`.
- WASM assets blocked from crawling (`Disallow: /assets/*.wasm$`).

Critical / High findings

F1 [Critical] Canonical/www host mismatch.

Every `<link rel="canonical">` and `<link rel="alternate" hreflang>` uses <https://compresspic.top/...> (no `www`). The server actually responds at <https://www.compresspic.top/...> and 200s the no-www version too (no redirect). Each version has a self-referencing canonical, so both are indexable as duplicates.

Fix: Pick `www` as canonical, redirect `compresspic.top/*` → 301 → <https://www.compresspic.top/:splat>, and update canonical/hreflang/sitemap URLs to use www.compresspic.top.

F2 [High] Trailing-slash 307 redirect mismatches canonical.

<https://www.compresspic.top/en-US/> → 307 → <https://www.compresspic.top/en-US>. Sitemap and canonical declare URLs **with** trailing slash, but server strips it.

Fix: Pick a canonical slash form. Either remove the 307 and update canonical/sitemap to no-slash, or reverse the redirect.

F3 [High] All unknown URLs return 200 (no 404).

Tested paths `/about`, `/privacy`, `/terms`, `/contact`, `/blog`, `/help`, `/random-nonexistent-page` all return HTTP 200 with `content-length: 5377` (the `index.html` shell). A `dist/404.html` exists locally but isn't served.

Fix: Cloudflare Pages redirect rule for any path not matching `^/$` or `^(/en-US|zh-TW|ja-JP|ko-KR|fr-FR|es-ES|tr-TR|fa-IR)$` → serve `404.html` with HTTP 404.

F4 [Medium] No security headers.

Response headers lack CSP, X-Frame-Options, X-Content-Type-Options, Referrer-Policy, Permissions-Policy.

Fix: Add via Cloudflare Transform Rules: `X-Content-Type-Options: nosniff`, `Referrer-Policy: strict-origin-when-cross-origin`, `X-Frame-Options: DENY`, `Permissions-Policy: camera=(), microphone=(), geolocation=()`. Verify HSTS is on.

F5 [Medium] Static asset cache-control is max-age=0.

Hashed assets (`index-CyHHZpPs.js`, `frog-hero-bg-1600.webp`) return `cache-control: public, max-age=0, must-revalidate`. Returning users re-download 581 KB JS every visit.

Fix: Set `/assets/*` → `Cache-Control: public, max-age=31536000, immutable`. Keep HTML/robots/sitemap at short TTL.

See also

- [findings/technical.md](#) for full detail including performance and sitemap analysis.

Content Quality — Score: 70 / 100

What works

- Clear, factual product description across all 9 locales.
- Privacy-first positioning is consistent in title, description, JSON-LD, and FAQ.
- Pre-render pipeline per locale (`scripts/prerender-locales.mjs`) gives every locale a localized `<head>`.
- FAQPage JSON-LD with 3 concrete Q&A pairs.

Findings

F6 [High] Static body is empty.

Each locale's pre-rendered HTML has only `<div id="root"></div>` in the body. Hero text, features, FAQ body are rendered client-side. Crawlers that don't execute JS (Bing in some cases, Baidu, in-app browsers, AI crawlers) see only the meta description.

Fix: Extend `scripts/prerender-locales.mjs` to also inline visible body content: `<h1>`, `<h2>` for feature sections, FAQ Q&A as plain HTML.

F7 [Medium] Short meta descriptions in CJK locales.

zh-CN 45 chars, zh-TW 43 chars, ja-JP 74 chars — all well below the 90–155 char sweet spot Google typically displays.

Fix: Expand to 80–120 chars (CJK). Include: supported formats, batch, free, browser support, privacy.

F8 [Medium] No About / Privacy Policy / Terms / Contact pages.

No author identity, no privacy policy, no terms, no contact email visible on the homepage. Limits E-E-A-T signals and trust.

Fix: Add `/about` (or `/docs`) page with author, project history, GitHub link. Add a minimal `/privacy` page stating the no-collection architecture. Both can be pre-rendered and added to sitemap.

F9 [Low] Single indexable page per locale.

With one page per locale, long-tail keyword coverage depends on the homepage ranking for everything.

Fix: Add 3–5 use-case landing pages (`/compress-for-email`, `/compress-for-web`, `/compress-for-whatsapp`, `/png-vs-webp`).

See also

- `findings/content.md` for E-E-A-T detail and readability analysis.

On-Page SEO — Score: 78 / 100

What works

- Title pattern `Brand - Descriptor` consistent across all 9 locales.
- All hreflang alternates declared correctly (9 locales + x-default).
- Comprehensive OG/Twitter tags including image dimensions, type, alt.
- Self-referencing canonical on every page (modulo www mismatch — see F1).
- Keyword targeting aligned with locale (■■■■■, image compression, ■■■■■, etc.).

Findings

F10 [Low] x-default is zh-CN.

English-speaking searchers landing on `/` see Chinese content.

Fix: If the site is primarily a Chinese tool, keep current x-default. If targeting global English-speaking users, change x-default to `/en-US/`.

F11 [Low] No internal links in static HTML.

All navigation is rendered client-side. Users without JS (and crawlers without JS execution) have no way to reach other locales.

Fix: Add a simple language picker to the prerendered body listing all 9 locales.

See also

- [findings/on-page.md](#) for per-locale keyword and tag analysis.

Schema & Structured Data — Score: 70 / 100

What works

- Valid JSON-LD across all 9 locales.
- Appropriate type selection: `WebSite` + `SoftwareApplication` + `FAQPage`.
- Localized strings (name, description, FAQ Q&A) per locale.
- `Offer` with `price: 0`, `priceCurrency: USD` correctly identifies the free app.

Findings

F12 [Medium] SoftwareApplication missing author, datePublished, softwareVersion.

Fields present: `@id`, `@type`, `applicationCategory`, `operatingSystem`, `url`, `description`, `image`, `offers`. Missing: `author` (linking to joye61/pic-smaller), `datePublished`, `softwareVersion` (currently 1.1.0), `featureList`.

Fix:

```
"author": { "@type": "Organization", "name": "joye61", "url":  
"https://github.com/joye61/pic-smaller" }, "datePublished": "2024-01-01", "softwareVersion":  
"1.1.0", "featureList": ["Local compression", "No server upload", "Multiple formats", "Batch  
support", "Open source MIT"]
```

F13 [Low] No Organization schema separate from SoftwareApplication.

Google Knowledge Graph needs an Organization entity to link the site to a brand.

Fix: Add a separate `Organization` block.

F14 [Low] FAQPage only has 3 Q&A (rich result policy restricted).

Google restricted FAQ rich results to government/health sites in 2023. AI crawlers extract these heavily though.

Fix: Expand FAQ to 6–10 Q&A: supported formats, max file size, browser compatibility, mobile, comparison vs other tools.

See also

- [findings/schema.md](#) for field-level analysis per entity.

Performance (CWV) — Score: 65 / 100

■■ PageSpeed Insights API was rate-limited (240 QPM cap) during this audit. Findings are based on raw asset inspection + first-principles estimation. No CrUX field data was available.

What works

- Gzip compression enabled (67–70% ratio) on all text.
- Hero image already in WebP format.
- Static asset bundle hashed for cache-busting.
- Cloudflare CDN with HTTP/2 + HTTP/3 (alt-svc) enabled.
- HTML payload small (5–7 KB pre-rendered per locale).

Findings

F15 [High] No preload hints for hero image or main JS bundle.

Only `preconnect` to `googletagmanager.com` is declared. No `<link rel="preload" as="image" href="/assets/frog-hero-bg-1600.webp">` and no `modulepreload` for the main JS chunk.

Fix: Add both to `<head>`. Expected LCP improvement: 200–500ms on mobile.

F16 [Medium] Antd bundled in full (581 KB JS / 188 KB gzipped).

Main JS chunk is large because Antd 5.x ships CSS-in-JS and barrel imports.

Fix: Switch from `import { ... } from 'antd'` to direct imports `import Button from 'antd/es/button'`. Target: < 300 KB gzipped.

F17 [Medium] Hero WebP not responsive (1600×686 served to mobile).

Same 109 KB hero image is served to all viewports.

Fix: Generate 800w and 1200w variants. Use `<picture>` with `<source media="...">`. Expected savings: 30–50% on mobile.

Estimated CWV (mobile, 4G, no field data)

- **LCP:** 1.8–2.8s. Hero render waits for HTML → JS parse → image fetch. **Borderline — improve.**

- **CLS:** ~0.00–0.05. Single hero, no late-loading fonts. **Good.**
- **INP:** Likely < 200ms. Few interactive elements. **Probably Good.**

See also

- [findings/performance.md](#) for asset-level breakdown.

AI Search Readiness — Score: 50 / 100

What works

- Clear factual product description suitable for AI extraction.
- FAQPage JSON-LD provides Q&A for AI summarization.
- Cloudflare **Content-Signal: search=yes, ai-train=no** — opt-out of training while allowing retrieval.
- Multi-language coverage declared via hreflang.

Findings

F18 [High] `/llms.txt` returns the SPA shell HTML.

<https://www.compresspic.top/llms.txt> returns HTTP 200 with the homepage HTML body (5377 bytes). LLM crawlers following the llmstxt.org convention extract garbage.

Fix: Create a real `/llms.txt` (plain text or markdown) describing the site for LLMs. Suggested content provided in [findings/geo.md](#).

F19 [Medium] All major AI training crawlers blocked.

GPTBot, ClaudeBot, Google-Extended, Bytespider, CCBot, Applebot-Extended, meta-externalagent, Amazonbot are all **Disallow: /**. This is a privacy-first choice but eliminates AI citation opportunities.

Fix: Keep `ai-train=no` for training. Consider allowing retrieval-only bots: [OAI-SearchBot](#), [PerplexityBot](#), [Claude-User](#), [Claude-SearchBot](#), [Applebot](#).

F20 [Medium] No Organization / author identity for AI to attribute.

No **Organization** schema, no GitHub link from homepage, no `/about` page. AI may hesitate to recommend an "anonymous" tool.

Fix: Add **Organization** schema linking to github.com/joye61/pic-smaller. Add a small footer link to the GitHub repo.

See also

- [findings/geo.md](#) for full llms.txt content and AI bot policy details.

Images — Score: 75 / 100

What works

- WebP format for hero image (saves 25–35% vs JPEG/PNG).
- OG image includes width, height, type, alt attributes.
- SVG favicon (vector, modern).
- Image dimensions (1600×686) appropriate for OG.

Findings

F21 [Medium] Hero image has no responsive variants.

Single 1600×686 hero WebP (109 KB) served to all viewports. Mobile users download desktop-sized assets.

Fix: Generate 800w and 1200w variants. Use `<picture>` with media queries.

F22 [Low] No apple-touch-icon declared.

iOS Safari uses the SVG favicon at low quality when adding to home screen.

Fix: Add `<link rel="apple-touch-icon" href="/logo-180.png">` or SVG.

- [findings/images.md](#) for image-level audit.

Prioritized Action Plan

Phase 1: Critical Fixes (Week 1)

Resolve canonical/www mismatch [Critical] — Engineering, 1–2 hrs

Resolve trailing-slash 307 redirect [High] — Engineering, 30 min

Configure 404 handling for non-existent paths [High] — Engineering, 1 hr

Create real `/llms.txt` [High] — Content/Marketing, 30 min

Phase 2: High-Impact Improvements (Weeks 2–3)

Long-cache hashed static assets [Medium] — Engineering, 30 min

Preload hero image and main JS bundle [High] — Engineering, 30 min

Expand CJK meta descriptions [Medium] — Content, 30 min

Inline visible body content in prerender [High] — Engineering, 2–3 hrs

Add security headers via Cloudflare Transform Rules [Medium] — Engineering, 1 hr

Phase 3: Content & Authority (Month 2)

Expand FAQ to 6–10 Q&A pairs [Low] — Content, 2 hrs

Enrich SoftwareApplication schema [Medium] — Engineering, 1 hr

Add About and Privacy Policy pages [Medium] — Content, 4 hrs

Add 3–5 use-case landing pages [Low] — Content + Eng, 1–2 days

Allow retrieval-only AI bots [Medium] — Engineering, 30 min

Responsive hero image variants [Medium] — Engineering, 2 hrs

Code-split Antd per component [Medium] — Engineering, 1 day

Phase 4: Monitoring & Iteration (Ongoing)

Google Search Console monitoring [Info] — Marketing, 1 hr

Bing Webmaster Tools setup [Info] — Marketing, 30 min

AI citation monitoring [Info] — Marketing, ongoing

Quarterly Lighthouse audit [Info] — Engineering, 1 hr

See [ACTION-PLAN.md](#) for full detail with concrete steps.

Caveats & Data Limitations

- **PageSpeed Insights API** was rate-limited (240 QPM cap reached during audit window). Lab Lighthouse scores and CrUX field data unavailable. Performance findings based on raw asset inspection + first-principles estimation.
- **Google Search Console data** unavailable — no API access configured.
- **Backlink data** unavailable — no Moz/Bing Webmaster credentials configured.
- **Common Crawl domain-level metrics** not fetched.
- **AI visibility checks** (live ChatGPT / Perplexity / Gemini queries) not run; recommendations based on signal presence rather than live measurement.
- **SPA content** — much of the visible page content is rendered client-side and could not be directly inspected without a headless browser. Findings assume the rendered DOM matches the prerender strings.

File Listing

- [audit-data.json](#) — Structured envelope for report generation
